Amendment Under 37. C.F.R § 1.111 U.S. Application No.: 09/970,679

## IN THE CLAIMS:

- 1. (Previously Presented) A gas-insulated multi-phase line made up of sections, each of which is formed by metal cladding filled with a dielectric gas under pressure and containing at least three phase conductors disposed in a triangle configuration, wherein two adjacent sections are connected together via a connection module whose metal cladding is locally made up of a plurality of tubular portions, each of which is filled with dielectric gas and has a single phase conductor passing through it, constituting a passive electrical connection.
- 2. (Previously Presented) The gas-insulated line of claim 1, in which the connection module is open at both ends so that the volumes of said sections communicate with each other.
- 3. (Previously Presented) The gas-insulated line of claim 1, in which the connection module is closed in gastight manner by one or more insulators at either or both of its ends so as to isolate two adjacent sections from each other, or so as to isolate said module from said sections.
- 4. (Previously Presented) A connection module for a gas-insulated electricity line of claim\_1, which connection module has metal\_cladding made up of a first dish-shaped end cap and of a second dish-shaped end cap, which caps are provided with orifices of aperture determined to enable phase conductors to pass through them with a sufficient isolation distance between each

Amendment Under 37. C.F.R § 1.111

U.S. Application No.: 09/970,679

conductor and the cladding, and in which connection module each of the tubular portions of said cladding of the module is formed of a link tube surrounding an orifice in the first end cap and an orifice in the second end cap, through which orifices the same phase conductor passes.

- 5. (Previously Presented) The connection module of claim 4, and in which one end cap is extended by said link tubes thereby forming an integrally-molded single piece therewith.
- 6. (Previously Presented) The connection module of claim 4, and in which the tubular portions are mutually parallel.
- 7. (Previously Presented) The connection module of claim 6 in which three tubular portions are disposed in an equilateral triangle configuration.
- 8. (Previously Presented) The connection module of claim 4, in which each of the tubular portions is surrounded by a determined volume of air.
- 9. (Previously Presented) The connection module of claim 4, in which windings forming the secondary of a current transformer are disposed in air around respective ones of said tubular portions.

Amendment Under 37. C.F.R § 1.111 U.S. Application No.: 09/970,679

10. (Previously Presented) The connection module of claim 4, in which sensors are disposed in air around or in the vicinity of respective ones of said tubular portions.

11. (Previously Presented) A method of assembling a connection module of claim 9, in which method each winding is firstly put in place around a tubular portion before the two end caps are assembled together via said tubular portions for forming the metal cladding of said module.

12. (New) The gas-insulated line of claim 1, wherein the connection module comprises a first end cap and a second end cap, and

wherein each of the first end cap and the second end cap surrounds the at least three phase conductors disposed in a triangle configuration.
